Abstract

Background

This study establishes an altitudinal gradient, spanning from the highland Andes (2400 m) to lowland Amazon, as a productive region for the study of bird pollination in Southeastern Peru. The 'Manú Gradient' has a rich history of ornithological research, the published data and resources from which lay the groundwork for analyses of plant-bird interactions. In this preliminary expedition we documented 44 plants exhibiting aspects of the bird pollination syndrome, and made field observations of hummingbird visits at three sites spanning the Manú Gradient: 2800 m (Wayqecha), 1400 m (San Pedro), and 400 m (Pantiacolla). Some of the documented plant taxa are underrepresented in the bird pollination literature and could be promising avenues for future analyses of their pollination biology. The Manú Gradient is currently the focus of a concerted, international effort to describe and study the birds in the region; we propose that this region of Southeastern Peru is a productive and perhaps underestimated system to gain insight into the ecology and evolution of bird pollination.

New information

Observations were made on 11, 19, and 14 putatively bird pollinated plant species found at the high-, mid- and low-elevation sites along the gradient, respectively. Hummingbirds visited 18 of these plant species, with some plant species being visited by multiple hummingbird species or the same hummingbird species on differing occasions. Morphometric data is presented for putatively bird-pollinated plants, along with bill measurements from hummingbirds captured at each of three sites. Voucher specimens from this study are deposited in the herbaria of the Universidad Nacional de Agraria de La Molina (MOL), Peru and the University of British Columbia (UBC), Canada. The specimens collected represent a 'snapshot' of the diversity of bird-pollinated flora as observed over 10 day sampling windows (per site) during the breeding season for hummingbirds of Manú.

Hummingbirds, elevational gradient, co-evolution, ornithophily, pollination ecology, Andes, Amazon, neotropics

Introduction

Manú National Park is a UNESCO Biosphere Reserve nested within the most biodiverse region in the world: the tropical Andes (Myers et al. 2000). Manú Park, and its surrounding forests encompass a remarkable elevational gradient (hereafter the 'Manú Gradient') of over 3000 m, reaching from the lowland Amazon rainforest to the Puna grasslands of the high Andes. The Manú Gradient has a rich history of ornithological research (discussed in Walker et al. 2006), and over the last decade the Manú Gradient has been the focus of numerous ornithological studies as part of the Manú Bird Project (e.g. Merkord 2010, Jankowski et al. 2012a, Jankowski et al. 2012b, Londoño et al. 2014, Londoño et al. 2016, Dehling et al. 2014, Munoz 2016). Along the gradient, tree composition and forest structure have also been described (e.g. Jankowski et al. 2012b, Malhi et al. 2010, Hillyer and Silman 2010). The wide interest in the avian community of Manú make it an ideal system for studying hummingbird pollination: population structure, range limits, and locations of uncommon and understudied hummingbirds are described and published. For example, focused studies of the high elevation Shining Sunbeam (*Aglaeactis cupripennis*) have demonstrated the effectiveness of the Manú Gradient as a study system for bird pollination (Hazlehurst et al. 2016, Hazlehurst and Karubian 2016). Therefore, the objectives of this study were to, 1) document the occurrence of putatively bird pollinated plants with voucher specimens along the Manú Gradient, 2) describe the occurrence and diversity of hummingbirds using mist-net surveys, and 3) record hummingbird visitations to flowering plants.

Materials and Methods

Site Selection

We surveyed three field sites spanning an altitudinal gradient of 2400 m (400 m to 2800 m) in the southeastern Andes (Table 5): La Estación Biológica Wayqecha (Paucartambo Province, Cuzco Region, 2800 m), San Pedro (Paucartambo Province, Cuzco Region, 1400 m), and Pantiacolla (Manú Province, Madre de Dios Region, 400 m). This area is one of the most biologically rich regions in the world with an estimated species pool of nearly 1100 birds (Walker et al. 2006). To our knowledge, a comprehensive survey of the vascular plants of the region does not exist, although an increasing number of plant identification resources for this region are being made available by the Field Museum of Natural History (<http://fieldguides.fieldmuseum.org>). Wayqecha is characterized as high elevation cloud forest, with a mosaic of mature forest and areas with shorter trees and woody shrubs that transitions into puna grassland above treeline. San Pedro is predominately mid-montane humid rainforest, but also includes the lower extent of the montane cloud forest. Pantiacolla is situated at the interface between the Andean foothills and the lowland Amazon. Detailed environmental characteristics for these sites have been summarized in Malhi et al. (2016). Sampling was carried out between September 4, 2016 and October 13, 2016, falling within the avian montane breeding season. A distinct rainy season occurs from November through April and a dry season from May through August. Annual precipitation for higher elevations (2700-3000 m) ranges from 1700-2000 mm (Girardin et al. 2010) and is generally >2000 mm for lowland (100-400 m elevation) sites (Rapp and Silman 2012). Time constraints afforded less than two weeks (10.3 ± 2.1 days) for botanical and avian sampling at each site.

Table 1.

Putatively bird pollinated plants along the Manú Gradient.

Plant Genus	Specific epithet	Family	Collection number(s) for plant specimens deposited in the herbaria of MOL and UBC	Corolla length (mm)	Corolla width (mm)	Nectar (% sugar, * = not recorded)	Corolla colour(s)	Hummingbird visited	Habitat notes
<i>Besleria</i> L.	sp. 1	Gesneriaceae	MMAB 1	8	1	*	red		Growing along trail's edge in relatively open canopy

<i>Heliconia</i> L.	sp. 1	Heliconiaceae	MMAB 10, 11	100	19	*	translucent with pink		Lowest point of a bog with little shade. Pioneering <i>Cecropia</i> and <i>Schefflera</i> are dominating species. <i>Ruellia</i> also abundant.
<i>Centropogon</i>	<i>granulosus</i> C. Presl	Campanulaceae	MMAB 12, 13	40	15	*	yellow within red bract		Along ditches of the Manu Road. Typically at points facing South-East. Relatively dry forest edge.
<i>Centropogon</i>	<i>granulosus</i> C. Presl	Campanulaceae	MMAB 2, 3	35	15	25.5	red and yellow		Vine growing through dense understory at 1-3 m. <i>Guadua</i> abundant. Flowers at breaks in the canopy where sunlight is more abundant.
<i>Sanchezia</i> Ruiz & Pav.	sp. 1	Acanthaceae	MMAB 20, 21	70	5	*	yellow within red bract		Along ditches of the Manu Road. Grows along weedy species including <i>Vernonia</i> , <i>Calceolaria</i> , and <i>Gloxinia</i>
<i>Columnea</i>	<i>guttata</i> Poepp. & Endl.	Gesneriaceae	MMAB 22, 23	10	1	20	yellow		Epiphytic. Found readily in the same habitats as that of <i>Columnea</i> sp. 1
<i>Heliconia</i>	<i>subulata</i> Ruiz & Pav.	Heliconiaceae	MMAB 24, 44	40	10	*	bright yellow in dark red bract		Found in dense stand of <i>Guadua</i> . Little sunlight, relatively dry.
<i>Guzmania</i>	<i>weberbaueri</i> Mez	Bromeliaceae	MMAB 25, 26	37	7	*	yellow	<i>Colibri thalassinus</i> , <i>Doryfera ludoviae</i> , <i>Heliodoxa leadbeateri</i>	Grows both as an epiphyte and from the ground. Always in high-moisture environments including bogs but less common near river's edge.
<i>Columnea</i>	cf. <i>inaequilatera</i> Poepp. & Endl.	Gesneriaceae	MMAB 27, 28	44	9	21.5	red		Edge of fast- flowing rocky river with little shade.

<i>Thrysacanthus</i> Moric	sp. 1	Acanthaceae	MMAB 29, 30	10	1	22.5	red-purple		Along ditch of the Manu Road. East-facing, well drained.
<i>Gurania</i>	<i>eriantha</i> Poep. & Endl.	Cucurbitaceae	MMAB 33	*	*	*	red		Along ditch of the Manu Road. Growing through dense vegetation, flowers at edge.
<i>Drymonia</i>	<i>semicordata</i> (Poep.) Wiehler	Gesneriaceae	MMAB 34, 35	10	2	*	yellow within red bract		Hanging over edge of fast- flowing rocky river. Shaded by various Araceae.
<i>Besleria</i> L.	sp. 1	Gesneriaceae	MMAB 36, 37	20	8	*	bright red		Wet, dark, steep rocky cliff. North facing.
<i>Drymonia</i>	<i>urceolata</i> Wiehler	Gesneriaceae	MMAB 40, 39	20	5	*	red		Wet, dark, steep rocky cliff. North facing.
<i>Erythrina</i> L.	sp. 1	Fabaceae	MMAB 42, 41	*	*	*	orange-red		Flowers found on ground at the lowest point of a bog with little shade.
<i>Passiflora</i>	<i>coccinea</i> Aubl.	Passifloraceae	MMAB 43, 38	120	60	22.5	red	Unidentified	Growing from 0-12 m through dense stand of Guadua.
<i>Centropogon</i>	<i>congestus</i> Gleason	Campanulaceae	MMAB 45	32	10	*	pink-red		Dense stand of Guadua. Relatively humid and little light.
<i>Oreocallis</i>	<i>grandiflora</i> (Lam.) R. Br.	Proteaceae	MMAB 49, 48	46	12	*	red-purple	<i>Aglaeactis cupripenni</i> , <i>Boissonneaua matthewsii</i>	Dominating tree species in dry, scrubby, elfin forest.
<i>Siphocampylus</i>	<i>scandens</i> (Kunth) G.Don	Campanulaceae	MMAB 50, 51	47	8	16	pink	<i>Adelomyia melanogenys</i>	Along ditch of the Manu Road. Grows indiscriminately in sun or shade.
<i>Siphocampylus</i>	<i>orbignianus</i> A.DC.	Campanulaceae	MMAB 52, 53	54	17	12	pink-red	<i>Coeligena</i> sp.	Along ditch of the Manu Road. Grows indiscriminately in sun or shade.
<i>Brachyotum</i>	<i>rostratum</i> (Naudin) Triana	Melastomataceae	MMAB 54, 55	19	7	13	red with yellow tip	<i>Aglaeactis cupripenni</i>	Dry scrubby elfin forest. Dead ferns make up dense mat up to 1 m.
<i>Aetanthus</i>	<i>nodosus</i> (Desr.) Engl.	Loranthaceae	MMAB 56, 57	70	5	14.5	dark purple	<i>Coeligena</i> sp.	Humid transitional forest at where elfin forest dimishes.

<i>Gaultheria</i> Kalm ex L.	sp. 1	Ericaceae	MMAB 58, 59	7	3	*	red with yellow tip	<i>Aglaeactis cupripenni</i> , <i>Metallura tyrianthina</i>	Edge of pond alongside other Ericaceae species. Abundant light, south facing.
<i>Miconia</i> Ruiz & Pavón	sp. 1	Melastomataceae	MMAB 6, 7	15	13	*	pink	<i>Heliodoxa leadbeateri</i>	3 m tree mostly shaded by <i>Cecropia</i> and other taller species.
<i>Passiflora</i>	<i>mixta</i> L.f.	Passifloraceae	MMAB 60, 61	118	45	*	white-pink	<i>Ensifera ensifera</i>	Growing through same habitat as Ericaceae gen. sp. 1 and 2. Flowers at breaks in the canopy.
<i>Fuchsia</i> L.	sp. 1	Onagraceae	MMAB 63, 62	65	45	*	bright pink		Humid, dark understory. Habitat tends to be rocky.
<i>Desmodium</i> Desv.	sp. 1	Fabaceae	MMAB 64, 65	20	19	16.5	light red- orange	<i>Metallura</i> sp.	Rocky exposed cliffside. Many ferns. Dry.
<i>Siphonandra</i> Klotzsch	sp. 1	Ericaceae	MMAB 66, 67	18	5	*	purple	<i>Aglaeactis cupripenni</i>	Edge of pond alongside other Ericaceae species. Abundant light, south facing.
<i>Bomarea</i> Mirb.	sp. 1	Alstroemeriaceae	MMAB 68, 69	18	7	18.5	red with white tip		Rocky cliff next to slow-flowing river. In dense vegetation including <i>Rubus</i> and <i>Asteraceae</i> spp.
<i>Drymonia</i>	<i>semicordata</i> (Poepp.) Wiehler	Gesneriaceae	MMAB 70, 71	40	17	*	yellow within red bract	<i>Glaucis hirsutus</i> , <i>Heliodoxa aurescens</i> , <i>Phaethornis</i> sp.	Ubiquitous throughout humid lowland forest.
<i>Pachystachys</i> Nees	sp. 1	Acanthaceae	MMAB 72	60	8	*	red		In the shade of tall trees at trail's edge.
<i>Costus</i> L.	sp. 3	Costaceae	MMAB 75, 74	30	5	*	yellow		Relatively common at trail's edge, even in low light.
<i>Heliconia</i>	<i>densiflora</i> Verl.	Heliconiaceae	MMAB 76, 77	47	7	*	orange within red bract		High moisture depression in humid forest. Medium shade.
<i>Costus</i> L.	sp. 2	Costaceae	MMAB 78, 79	39	7	*	yellow within red bract		Terra firma approx 300 m from Rio Madre de Dios

<i>Columnea</i>	aff. <i>schimpfii</i> Mansf.	Gesneriaceae	MMAB 8, 9	30	5	*	white		Epiphytic. Can be found indiscriminately on any trees from at least 1-8 m.
<i>Besleria</i> L.	sp. 4	Gesneriaceae	MMAB 80, 81	22	8	*	red		Terra firma approx 300 m from Rio Madre de Dios
<i>Heliconia</i>	<i>schumanniana</i> Loes.	Heliconiaceae	MMAB 82, 83	44	5	*	yellow within red bract		Abundant sunlight at clearing in forest.
<i>Heliconia</i>	<i>lingulata</i> Ruiz & Pav.	Heliconiaceae	MMAB 84, 85	37	4	*	yellow within yellow bract		South-facing clay bank of the Alto Madre de Dios.
<i>Besleria</i> L.	sp. 2	Gesneriaceae	MMAB 86, 87	19	9	*	orange	Unidentified	Terra firma approx 300 m from Rio Madre de Dios
<i>Besleria</i> L.	sp. 3	Gesneriaceae	MMAB 88, 89	15	4	*	orange	Unidentified	Relatively exposed at trail's edge. Dense cluster of upto 20 individuals.
<i>Heliconia</i>	<i>metallica</i> Planch. & Linden ex Hook.	Heliconiaceae	MMAB 90, 91	40	4	*	red	<i>Phaethornis</i> sp.	High moisture depression in humid forest. Medium shade.
<i>Pentagonia</i> Benth.	sp. 1	Rubiaceae	MMAB 93, 92	31	10	*	yellow within red bract	Unidentified	High moisture depression in humid forest. Medium shade.
<i>Passiflora</i> L.	sp. 1	Passifloraceae	MMAB 94, 95	80mm long, pre-anthesis	*	*	red		Growing through dense understory including Melastomaceae.
<i>Pachystachys</i> Nees	sp. 2	Acanthaceae	MMAB 96, 97	50	17	*	red	<i>Phaethornis</i> sp.	Relatively exposed at trail's edge.

Table 2.

Records of hummingbird-plant visitation along the Manú Gradient.

Table 5.

Summary information and site descriptions for three sampling points along the Manú Gradient.

Site (Latitude, Longitude)	Period Collected and Netted	Altitudinal Range Sampled (m asl)	Number of Plants Species Collected	Number of Hummingbirds Netted	Number of Hummingbird Species Netted	Number of Bird Visits Recorded	General Site Description
San Pedro (-13.055387, -71.546832)	4-ix-2016 to 16-ix-2016	1149 - 1547	19	76	14	7	Montane cloud forest, <i>Cecropia</i> readily found in disturbed habitats. Dominant palm is <i>Wettinia</i> and canopy is generally composed of Clusiaceae, Rubiaceae, Melastomataceae and Lauraceae (Weng et al. 2004).
Wayqecha (-13.1752615, -71.5884099)	20-ix-2016 to 03-x-2016	2625 - 2979	11	65	15	10	Highland cloud forest and puna grassland of mainly Asteraceae and Poaceae. <i>Oreocalis grandiflora</i> is a notable and abundant tree species. Araliaceae, Cunoniaceae, Chloranthaceae, Myrsinaceae, Sabiaceae, and Symplocaceae are readily found (Weng et al. 2004).
Pantiacolla (-12.656544, -71.231862)	07-x-2016 to 13-x-2016	391 - 428	14	31	9	8	Lowland rainforest, includes both seasonally flooded and terra firme forests. Canopy dominated by Fabaceae, Malvaceae, Moraceae and Annonaceae (Weng et al. 2004, Weng et al. 2004)

Data Collection

Pre-cut singletrack trails were used to access sampling areas away from the Manú Road (main access road that runs along the southeastern border of Manú National Park). We sampled hummingbirds using standard (12 x 3 m, 34 mm mesh) mist-nets along trail systems only. Mist-netting sites were sampled during the primary breeding season (August–November) for two consecutive days from approximately 0600–1200 hrs during suitable weather conditions (i.e., no periods of extended heavy rain, high winds, or other situations that could compromise researcher or bird safety). Each site consisted of an array of ten to fifteen nets placed in forested and open habitat and spaced at intervals of 25–50

m. Ten sites were sampled at Wayqecha and San Pedro, and 8 sites were sampled at Pantiacolla. Hummingbird bill length was measured from the bill tip to the nares. Bill width was measured from the anterior edge of the nares. All captured hummingbirds were marked by cutting the terminal 1-2 cm of one rectrix to avoid resampling of individuals.

Both trails and the Manú Road were used to opportunistically collect plants. Plants were considered putatively bird pollinated if they met criteria adhering to typical bird pollination ‘syndromes’; namely, dilute nectar and long tubular flowers (Fenster et al. 2004), though we acknowledge the limitations of surveying by these criteria (Ollerton et al. 2009). Plants of interest were photographed, their location marked using a hand-held Garmin 64s global positioning system, and a description of the immediate habitat recorded. We then measured nectar concentration of mature flowers (Sper Scientific no. 66214-988), recorded corolla dimensions and colour (by visual inspection), and processed each plant using standard herbarium techniques Bridson and Forman 2000) (SERFOR collection permit no. 343-2016). All dried and pressed specimens are deposited at the herbaria of the Universidad Nacional Agraria La Molina (MOL), Peru and the University of British Columbia (UBC), Canada (SERFOR export permit no. 09125-2017).

Results

We identified 44 putatively bird pollinated plants of interest belonging to 16 families (Table 1, Figs 1, 2, 3, 4, 5). Corolla length and width of sampled plants ranged from 8-120 mm ($\bar{x} = 39.7 \pm 27.4$, $n = 42$) and 1-60 mm ($\bar{x} = 11.4 \pm 12.2$), respectively. We measured nectar concentration for 11 of these species. In each case, nectar concentrations fell within a typical bird pollination syndrome (Stiles 1978, Fenster et al. 2004), ranging from 12-25.5% (Table 1). Corolla colour and immediate habitat characteristics were recorded for each plant (Table 1, see also Table 5).

We recorded 23 hummingbird visitations to 18 plant taxa belonging to 12 plant families (Table 2). Bill length and width of sampled hummingbirds ranged from 11.5-39.6 mm ($\bar{x} = 24.3 \pm 7.6$, $n = 41$) and 2.5-3.0 mm ($\bar{x} = 2.9 \pm 0.4$, $n = 40$), respectively (Figs 6, 7, 8, Table 3).

Diversity of plants exhibiting the bird pollination syndrome does not differ across the gradient in the time frame sampled (Table 4).

Discussion

Hummingbird pollination is common and well-established in Neotropical montane and lowland environments. Our observations and collected specimens exemplify that bird-plant interactions are readily observed along the Manú Gradient - an area that is relatively accessible has been subject to only a handful of studies on hummingbird pollination (*Oreocallis grandiflora*, Proteaceae; Hazlehurst et al. 2016, Hazlehurst and Karubian 2016).

Along the gradient, putatively bird pollinated plants were generally characterized by long corollas and were predominantly coloured red, yellow, orange, or some combination thereof. Previous documentation of bird pollination exists for each of the 16 families collected (Cronk and Ojeda 2008, Johnson and Nicolson 2008), but undocumented species-level bird pollination systems may arise from focusing on lesser-studied taxa (e.g. *Thyrsacanthus*, *Pentagonia*, *Pachystachys*). Many putatively bird pollinated plants contained too little nectar to effectively measure sugar concentration at the time of sampling. We suspect that early morning visitations by nectarivorous birds and insects (i.e., both pollinators and nectar robbers) influenced this outcome. Indeed, in some cases inspection of certain plants revealed that the flower had been recently robbed as indicated by punctures at the base of the corolla. In as little as bird pollination has been studied along the Manú Gradient, even less is known of the ecological and evolutionary dynamics of nectary robbery. As this survey was preliminary, time did not allow for multi-day sampling at one locale to isolate nectar. A focus on a specific plant taxon would allow familiarity for nectar phenology and hence, more effective collection of nectar.

We recorded 23 independent visits by hummingbirds to 19 different plant taxa over 33 days. These observations by no means represent a comprehensive list of the total diversity for hummingbirds (Walker et al. 2006), bird-pollinated plants, or the interactions between

these two groups. An estimate of total diversity will come only with an extended sampling effort at each site. Relatively few hummingbirds were captured or observed in the lowlands (Table 3) compared to the other two sites. It is likely that this resulted from differences in foraging behavior between hummingbird species, rather than local abundance. For example, in the lowlands, a higher proportion of hummingbirds (e.g. *Phaethornis*) exhibit traplining behaviour (i.e. repeated visits along a route of flowering locations) compared to territorial guarding of floral resources. In addition, because of the higher canopy, many of the trees, lianas, and epiphytes inhabit canopy heights that are logically difficult to sample.

The number of plants exhibiting bird pollination syndrome and number of bird visits observed are comparable between sites. That is, at a coarse scale we did not find any indication that elevation affects the absolute diversity of bird pollinated plant taxa (as expected by Cruden 1972), although the Manú Gradient would be an ideal location to test the hypothesis that bird and insect pollinated plants occupy distinct ecological niches. Between species, corolla length and width encompasses a great amount of variation, but hummingbird bill morphology varies less Tables 1, 3. This may speak to the adaptability of flowers relative to bills. It may be that because flowers serve a singular purpose (attraction and exclusion of pollinators and robbers, respectively), whereas bills have many uses (feeding, aggression, preening, balance), that bill evolution is relatively constrained. Bill morphology data will be used to inform phylogenetic tests of bill-flower shape evolution in future studies.

Evaluating the extent to which plants and their pollinators contribute to maintaining local biodiversity, and identifying keystone species within these systems (Ebenman and Jonsson 2005) will be important to maintaining ecological and cultural heritage in the Manú region (Ministerio del Ambiente (Ministry of Environment) 2017). This study provides a baseline for future work in pollination ecology along the Manú Gradient. Any one of the 44 plant species highlighted here warrants closer investigation, and we anticipate that further studies will help clarify the roles of hummingbirds as pollinators for the plant taxa described herein..

Acknowledgements

The authors would like to acknowledge Daniela Olivera (Universidad Nacional de San Antonio Abad del Cusco) for their assistance in the field, as well as the staff of Wayqecha Biological Station, Cock-of-the-Rock Lodge, and Pantiacolla Lodge. We also acknowledge Jenny Muñoz (University of British Columbia), the Asociación para la Conservación de la Cuenca Amazónica (ACCA), and the Servicio Nacional Forestal y de Fauna Silvestre (SERFOR) for assistance in administering research permits, and Prof. Carlos Reynel and the herbarium staff at Universidad Nacional Agraria La Molina for generously providing assistance at all stages of this project. Identification of our Gesneriaceae specimens were greatly improved by Dr. John Clark (University of Alabama). Identification of numerous other specimens were assisted by Dr. Quentin Cronk (University of British Columbia). This

expedition was supported by grants from the Natural Sciences and Engineering Research Council of Canada (NSERC) Discovery Grants Program, held by Dr. Quentin Cronk (RGPIN-2014-05820) and Dr. Jill Jankowski (RGPIN-2012-418294), as well as a Walter H. Lewis Award in Plant Biodiversity to MMA Boehm and a Werner and Hildegard Hesse Research Award to MN Scholer.
